## **Lab-Report**

Report No: 03

Course code: ICT-4202

Course title: Wireless and Mobile Communication Lab

Date of Submission: 11-09-20

### **Submitted by**

Name: SK Mushfiqur Rahman

ID: IT-16013

4<sup>th</sup> year 2<sup>nd</sup> semester

Session: 2015-2016

Dept. of ICT

### **Submitted To**

Nazrul Islam

Assistant Professor

Dept. of ICT

MBSTU.

## Objective:

For TCP and router queues, we have to create a simple topology with two client node1, node 2 on the left side and node3 and node4 in the right side. We have to add drop tail queues of size QueueSize5 and QueueSize6 to Node5 and Node5 and Node6. Install a TCP socket instance on Node1 that will connect to Node3.

We have to install a TCP socket instance on Node2 that will connect to Node3 and also install a TCP socket instance on Node2 that will connect to Node4. Measure packet loss and cwnd size, and plot graphs throughput/time, cwnd/time and packet loss/time for each of the flows.

## Output:

A terminal window titled 'mushfiq@mushfiq-VirtualBox: ~/Downloads/ns-allinone-3.29/ns-3.29' displays the output of running 'waf --run scratch/queue-discs-benchmark'. The output shows Waf entering and leaving the build directory, storing build commands in 'build/compile\_commands.json', and reporting a successful build in 23.010s. Following the build, 16 lines of network test results are shown, each representing a V4Ping test on a specific node and application list, with Round Trip Times (Rtt) ranging from 109ms to 112ms.

## Conclusion:

The specific characteristics of TCP and Router queues include the manner in which they avoid routing loops, the manner in which they select preferred routes, using information. This has the added benefit of preventing issues with TCP and router queues loops. TCP and router is related to connecting the network packages simultaneously.
